(54) Title: BETA-CARBOLINE PHARMACEUTICAL COMPOSITIONS

(57) Abstract: Formulations containing a PDE5 inhibitor, a water-soluble diluent, a lubricant, a hydrophilic binder, a disintegrant, and optional microcrystalline cellulose and/or a wetting agent, and their use in treating sexual dysfunction.

- 1 -

β -CARBOLINE PHARMACEUTICAL COMPOSITIONS

CROSS REFERENCE TO RELATED APPLICATION

5 This application claims the benefit of
provisional U.S. Patent Application Serial No.
60/146,924, filed August 3, 1999.

FIELD OF THE INVENTION

10

This invention relates to the fields of pharmaceutical and organic chemistry involving β -carboline compounds which are useful in the treatment of the various medical indications where inhibition of type 5 cGMP-specific phosphodiesterase is desired. More particularly, β -carboline compounds are formulated in a manner providing uniform potency, and desirable stability and bioavailability characteristics.

15

BACKGROUND OF THE INVENTION

The biochemical, physiological, and clinical effects of cyclic guanosine 3',5'-monophosphate specific phosphodiesterase (cGMP-specific PDE) inhibitors suggest their utility in a variety of disease states in which modulation of smooth muscle, renal, hemostatic, inflammatory, and/or endocrine function is desired. Type 5 cGMP-specific phosphodiesterase (PDE5) is the major cGMP hydrolyzing enzyme in vascular smooth muscle, and its expression in penile corpus cavernosum has been reported (A. Taher et al., *J. Urol.*, 149, pp. 285A (1993)).

- 2 -

Thus, PDE5 is an attractive target in the treatment of sexual dysfunction (K.J. Murray, *DN&P* 6(3), pp. 150-56 (1993)).

5 Daugan U.S. Patent No. 5,859,006 discloses a class of β -carbolines, and pharmaceutical compositions thereof, which are useful in the treatment of conditions wherein inhibition of PDE5 is desired. Also, see PCT publication WO 97/03675 disclosing the use of such β -carbolines for the treatment of sexual
10 dysfunction.

The poor solubility of many β -carbolines useful as PDE5 inhibitors has prompted the development of coprecipitate preparations, as disclosed in Butler U.S. Patent No. 5,985,326. Briefly described, coprecipitates of β -carbolines with a polymer, e.g., hydroxypropyl methylcellulose phthalate, were prepared, then milled, mixed with excipients, and compressed into tablets for oral administration. However, studies revealed some difficulties in generating precisely reproducible lots of coprecipitate product, thereby making the use of coprecipitates less than ideal for pharmaceutical formulations.
20
15

In addition, clinical studies involving
25 administration of tablets containing such a coprecipitate preliminarily revealed that maximum blood concentration of the β -carboline is achieved in 3 to 4 hours, with the average time for onset of a therapeutic effect as yet not precisely determined. When
30 used for the treatment of sexual dysfunction, such as male erectile dysfunction or female arousal disorder, a more rapid attainment of maximum blood concentration, along with a greater prospect for

- 3 -

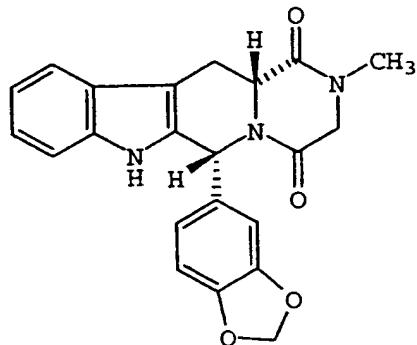

rapid onset of therapeutic effect, is desired by patients, who prefer more immediate effects. Accordingly, there is a continuing need in the art for oral dosage forms of β -carbolines, and pharmaceutical compositions thereof, useful in the treatment of conditions where inhibition of PDE5 is beneficial.

SUMMARY OF THE INVENTION

10

This invention provides pharmaceutical formulations comprising a compound of structural formula (I):

15

20

(I)

25

named (6R-trans)-6-(1,3-benzodioxol-5-yl)-2,3,6,7,12,12a-hexahydro-2-methylpyrazino-[1',2':1,6]pyrido[3,4-b]indole-1,4-dione, and alternatively named (6R,12aR)-2,3,6,7,12,12a-hexahydro-2-methyl-6-(3,4-methylenedioxophenyl)pyrazino-[2',1':6,1]pyrido[3,4-b]indole-1,4-dione,

- 4 -

and pharmaceutically acceptable salts and solvates thereof, wherein the compound preferably is provided as a free drug,

in admixture with a diluent, a lubricant,
5 a hydrophilic binder selected from the group consisting of a cellulose derivative, povidone, and a mixture thereof, a disintegrant selected from the group consisting of crospovidone, croscarmellose sodium, and a mixture thereof, and, optionally,
10 microcrystalline cellulose and/or a wetting agent. Optionally, the formulation additionally comprises a second diluent.

A most preferred pharmaceutical formulation of the present invention comprises: (a) about 1 to about 5, and more preferably about 2 to about 15 4, weight percent of the compound of structural formula (I), provided as free drug; (b) about 50 to about 85 weight percent, and preferably about 50 to about 75 percent, lactose; (c) about 0.25 to about 2 20 weight percent magnesium stearate; (d) about 1 to about 5 weight percent hydroxypropylcellulose; (e) about 3 to about 15 weight percent croscarmellose sodium; (f) 0 to about 40 weight percent microcrystalline cellulose; and (g) 0 to about 5 weight 25 percent sodium lauryl sulfate.

The present invention further relates to the use of such formulations for treatment of sexual dysfunction, e.g., male erectile dysfunction and female arousal disorder. The formulations can be 30 administered orally as a compressed tablet or as dry, free-flowing particles encapsulated in a hard shell, for example, a gelatin shell.

- 5 -

DETAILED DESCRIPTION OF THE INVENTION

For purposes of the invention disclosed and claimed herein, the following terms and abbreviations have the following meanings.

The term "treatment" is defined to include preventing, lowering, stopping, or reversing the progression or severity of a condition or symptom being treated. As such, the present invention includes both medical therapeutic and/or prophylactic administration, as appropriate.

The term "effective amount" is an amount of a pharmaceutical formulation that is effective in treating the desired condition or symptom. An effective amount of the compound of structural formula (I) to treat sexual dysfunction in a male is an amount sufficient to provide and sustain an erection capable of penetrating his partner. An effective amount of the compound of structural formula (I) to treat female sexual dysfunction, particularly female arousal disorder, is an amount sufficient to enhance the patient's ability to achieve or sustain an aroused state.

The term "free drug" refers to solid particles consisting essentially of the compound of structural formula (I), as opposed to the compound intimately embedded in a polymeric coprecipitate.

The term "lubricant" refers to pharmaceutically acceptable agents that are commonly used in the art as lubricants or glidants in the preparation of solid pharmaceutical formulations. Representative lubricants include, but are not limited to, agents such as talc, magnesium stearate, calcium

- 6 -

stearate, stearic acid, colloidal silicon dioxide, calcium silicate, a starch, mineral oil, a wax, glyceryl behenate, a polyethylene glycol, sodium benzoate, sodium acetate, sodium stearyl fumarate, and hydrogenated vegetable oils. Preferably, the lubricant is selected from the group consisting of magnesium stearate, sodium stearyl fumarate, and stearic acid. Most preferably, the lubricant is magnesium stearate.

The term "solvate" refers one or more molecules of a solute associated with a molecule of a compound, such as the compound of structural formula (I) associated with a molecule of water or acetic acid.

The term "solid oral dosage form" is used in a general sense to refer to solid pharmaceutical products administered orally. Solid oral dosage forms are recognized by those skilled in the art to include such forms as tablets and capsules, for example.

The term "water-soluble diluent" refers to compounds typically used in the formulation of pharmaceuticals to impart bulk for the manufacture of a tablet of practical size. Water-soluble diluents include, but are not limited to, sugars (including lactose, sucrose, and dextrose), polysaccharides (including dextrates and maltodextrin), polyols (including mannitol, xylitol, and sorbitol), and cyclodextrins.

The term "wetting agent" refers to anionic, cationic, and nonionic surfactants. Nonlimiting, representative wetting agents include sodium lauryl sulfate, docosate sodium (i.e., bis(2-ethyl-

- 7 -

hexyl) sodium sulfosuccinate), ethoxylated castor oil, polyglycolized glycerides, acetylated mono-glycerides, sorbitan fatty acid esters, poloxamers, polyoxyethylene sorbitan fatty acid esters, polyoxyethylene derivatives, monoglycerides and ethoxylated derivatives thereof, and diglycerides and ethoxylated derivatives thereof. Preferably the surfactant is sodium lauryl sulfate or a polyoxyethylene sorbitan fatty acid ester, particularly polysorbate 80.

The nomenclature describing particle size is commonly referred to herein as the "d90." A d90 of 40 means that at least 90% of the particles have a particle size less than 40 microns.

As previously stated, the present invention provides pharmaceutical formulations containing the compound of structural formula (I), as disclosed in Daugan U.S. Patent No. 5,859,006, and pharmaceutically acceptable solvates thereof. A preferred solvent suitable to prepare the compound of structural formula (I) includes acetic acid.

Applicants have found that dosage uniformity, stability, and bioavailability are enhanced by formulating (6R-trans)-6-(1,3-benzodioxol-5-yl)-2,3,6,7,12,12a-hexahydro-2-methylpyrazino-[1',2':1,6]pyrido[3,4-b]indole-1,4-dione (i.e., the compound of structural formula (I), also referred to herein as Compound A), as the active compound with a particular combination of pharmaceutical excipients. The formulations of present invention comprise mixtures of the active compound with a water-soluble diluent, a lubricant, a hydrophilic binder, croscarmellose sodium or crospovidone as a disintegrant,

- 8 -

and, optionally, microcrystalline cellulose and/or a wetting agent.

The total amount of active Compound A in the pharmaceutical formulations is about 0.1% to about 45%, preferably about 0.5% to about 10%, by weight of the formulation. In more preferred embodiments, the active compound is present in an amount of about 1% to about 4%, and most preferably, about 2% to about 4%, by weight of the formulation.

10 The compound of structural formula (I) can be made according to established procedures, such as those disclosed in Daugan U.S. Patent No. 5,859,006, incorporated herein by reference.

15 The particle size of the active compound also has been found to enhance the bioavailability and handling of the present formulations. Thus, the particle size of the compound of structural formula (I) prior to formulation is controlled by milling the raw compound (as a crystal, amorphous precipitate, or mixture thereof) such that at least 90% of the particles have a particle size of less than about 40 microns ($d_{90}=40$), and preferably less than about 30 microns. More preferably, at least 90% of the particles have a particle size of less than about 25 microns, still more preferably, less than about 15 microns, and most preferably, less than about 10 microns.

20

25

30 Methods for determining the size of particles are well known in the art. The following nonlimiting method disclosed in U.S. Patent No. 4,605,517, incorporated herein by reference, can be employed. In particular, the laser scattering particle size distribution analysis is effected on a

- 9 -

small sample of the reduced material which is suspended in approximately 180 ml of dispersant solution. The sample is added to the dispersant until an acceptable level of laser light obscuration is
5 achieved, at which point the particle size distribution is measured. Prior to sample suspension, a dispersant solution is prepared by preparing a solution of 0.1% SPAN 80 (sorbitan oleate) in cyclohexane which is presaturated with the compound. The
10 dispersant solution is filtered through a 0.2 micron microporous membrane filter to provide the necessary particle-free suspending dispersant. Triplicate measurements are effected as a minimum (a) to produce more reliable measurements, and (b) to check
15 the equivalent sampling of the suspended material. The results are automatically recorded and displayed graphically to give a cumulative % undersize vs. diameter, and a frequency percentage vs. diameter for the sample. From this data, the median equivalent spherical volume diameter value and d₉₀ are
20 derived (90% undersize value) together with the standard deviation of the distribution calculated as above.

A water-soluble diluent is present in the
25 formulation in an amount sufficient to provide adequate bulk to the formulation, and to effect tablet manufacture. A preferred water-soluble diluent is lactose, present in an amount of about 50% to about 85%, and preferably, about 50% to about
30 75%, by weight.

A hydrophilic binder is provided in an amount sufficient to act as an adhesive to hold Compound A and excipients together in a tablet. A

- 10 -

hydrophilic binder also is present in a powder formulation introduced into a hard gelatin shell. In dry powder formulations, the hydrophilic binder facilitates powder manufacture and handling, and enhances stability of the active compound.

A preferred hydrophilic binder is a cellulose derivative, including, for example, hydroxypropylcellulose and hydroxypropyl methylcellulose. Other hydrophilic cellulose derivatives include, but are not limited to, hydroxyethylcellulose and hydroxybutyl methylcellulose. Another nonlimiting hydrophilic binder is povidone. Preferably, the amount of hydrophilic binder present in the formulation is about 1% to about 5%, by weight of the formulation.

While binders such as povidone provide suitable adhesive characteristics, it has been found that the binder is important with respect to the stability of the β -carboline compound. Hydroxypropylcellulose and hydroxypropyl methylcellulose offer acceptable adhesion, while avoiding the oxidative instability attributed to povidone, and thus are preferred binders.

The croscarmellose sodium and crospovidone promote disintegration of the formulation, and especially a tablet dosage form, after administration and upon contact with water. Croscarmellose sodium and crospovidone are particularly advantageous when used in an amount of about 3% to about 15%, and especially about 3% to about 10%, by weight of the formulation. Croscarmellose sodium, also known as carboxymethylcellulose sodium crosslinked,

- 11 -

is the preferred disintegrant. Crospovidone is crosslinked povidone.

A lubricant is provided in an amount sufficient to reduce die wall friction during compression of the formulation into tablets. Preferably, the lubricant is magnesium stearate, present in an amount of about 0.25% to about 2.0%, by weight of the formulation. A lubricant also facilitates handling of the dry powder form of the formulation.

Microcrystalline cellulose is present at 0 to about 40% by weight in the present compositions. Microcrystalline cellulose can serve multiple functions in the formulation, e.g., a disintegrant and/or a second diluent in addition to the water-soluble diluent.

If desired, wetting agents are provided in an amount sufficient to decrease interfacial tension between drug particles and the dissolving medium (e.g., gastric fluids), and thereby enhance drug dissolution and absorption. Preferably, the surfactant is sodium lauryl sulfate or a polyoxyethylene sorbitan fatty acid ester, particularly polysorbate 80, in an amount of 0% to about 5%, and preferably about 0.1% to about 5%, by weight of the formulation.

Additional optional ingredients, such as coloring or flavoring agents, can be incorporated into the formulation in an amount sufficient to perform their intended function without adversely affecting either the powder formulation or tablets manufactured using the formulation.

- 12 -

In preferred embodiments, the relative percentage of formulation components (by weight) is as follows:

5

	Quantity (% by weight)
Compound of Structural Formula (I)	1 to 4
Lactose (diluent)	50 to 85
Hydrophilic Binder	1 to 5
Croscarmellose Sodium (disintegrant)	3 to 15
Sodium Lauryl Sulfate (wetting agent)	0 to 5
Microcrystalline Cellulose (diluent/disintegrant)	0 to 40
Magnesium Stearate (lubricant)	0.25 to 2

10

15

20

25

30

The formulations of the present invention can be prepared by a variety of techniques recognized in the art. Such techniques include, for example, wet granulation followed by drying, milling and compression into tablets with or without film coating, dry granulation followed by milling, compression into tablets with or without film coating, dry blending followed by compression into tablets, with or with film coating, molded tablets, wet granulation, dried and filled into gelatin capsules, dry blend filled into gelatin capsules, or suspension or solution filled into gelatin capsules.

Generally, the compositions have identifying marks which are debossed or imprinted on the surface.

In addition to improved dissolution and in vivo absorption, another important physical property is stability. The present invention provides formu-

- 13 -

lations with improved stability over prior formula-tions.

The specific dose of Compound A administered according to the present invention is determined by the particular circumstances surrounding the case including, for example, the route of administration, the dosage form, the condition of the patient, and the pathological condition being treated. A typical daily dose contains a dosage level of about 1 to about 20 mg/day of the compound of structural formula (I). Preferred daily doses generally are about 1 to about 10 mg/day, particularly about 5 mg or about 10 mg tablets or capsules, administered once per day. The most preferred dosage form is a tablet. Multiple doses can be taken to achieve a total dose of up to 20 mg/day of the compound of structural formula (I). The selection of dose level is decided by the attending physician.

One useful dosage form is a hard capsule comprising a powdered form of the formulation in a hard, soluble shell. In accordance with the present invention, the hard capsules are a solid dosage form in which dry, free-flowing particles of the drug formulation are filled in a hard container or shell comprising a gelatin, a starch, or other capsule materials well known to persons skilled in the art. Gelatin possesses unique properties which make gelatin the primary material for the manufacture of hard capsule shells. Another example of a useful capsule material is potato starch.

Hard capsules provide some advantages over other solid dosage forms, such as tablets. For

- 14 -

example, many patients prefer capsules because capsules are easier to swallow. Thus, capsule forms of a drug often are made available in addition to tablet forms.

5 A hard capsule has a hard shell completely surrounding the dry formulation. Typically, the dry drug formulation is added to a first section of the capsule, then a second section of the capsule is slipped over an open end of the first section to surround the drug formulation. The size and shape of the hard shell can vary, but typically is cylindrical with rounded ends. The size of the capsule is related to the dose level of the drug encapsulated by the shell, and to the particular drug formulation.

10

15

A hard capsule oral dosage form typically is prepared such that the shell ruptures or dissolves to release the enclosed drug formulation within five to ten minutes after ingestion. Manufacture of the hard shell, and the capsules, is performed in accordance with methods well known in the art.

20

The following formulation examples are illustrative only, and are not intended to limit the scope of the present invention. In particular, the following examples are directed to tablets, but the identical formulations, in a dry free-flowing particulate or powder form, can be used in a hard capsule.

25

- 15 -

EXAMPLE 1

5 Lot 1 of Compound A was made using a 12 inch pancake style jet mill fed at a rate of 28 to 30 kg/hour with sufficient grind pressure to produce material having a d₉₀ of 4 microns.

The following formula was used to prepare the finished dosage form, i.e., a tablet providing 10.0 mg of Compound A from Lot 1 material.

10

Ingredient	Quantity (mg)
Granulation	
Compound A (d ₉₀ of 4)	10.0
Lactose Monohydrate	153.8
Lactose Monohydrate (spray dried)	25.0
Hydroxypropyl Cellulose	4.0
Croscarmellose Sodium	9.0
Hydroxypropyl Cellulose (EF)	1.75
Sodium Lauryl Sulfate	0.7
Outside Powders	
Microcrystalline Cellulose (Granular-102)	37.5
Croscarmellose Sodium	7.0
Magnesium Stearate (vegetable)	1.25
Total	250 mg

25

Purified Water, USP was used in the manufacture of the tablets. The water was removed during processing, and minimal levels remained in the finished product.

30 The tablets were manufactured using a wet granulation process. A step by step description of the process follows: Compound A and excipients were

- 16 -

security sieved. The selective PDE5 inhibitor (i.e., Compound A) was dry blended with lactose monohydrate (spray dried), hydroxypropyl cellulose, croscarmellulose sodium, and lactose monohydrate.

5 The resulting powder blend was granulated with an aqueous solution of hydroxypropyl cellulose and sodium lauryl sulfate using a Powrex or other suitable high shear granulator. Additional water can be added to reach the desired endpoint. A mill
10 can be used to delump the wet granulation and facilitate drying. The wet granulation was dried using either a fluid bed dryer or a drying oven. After the material was dried, it can be sized to eliminate large agglomerates.

15 Microcrystalline cellulose, croscarmellose sodium, and magnesium stearate were security sieved and added to the dry sized granules. These excipients and the dry granulation were mixed until uniform, using a tumble bin, ribbon mixer, or other
20 suitable mixing equipment. The mixing process can be separated into two phases: (a) the microcrystalline cellulose, croscarmellose sodium and the dried granulation are added to the mixer and blended, followed by (b) the addition of the magnesium
25 stearate to this granulation and a second mixing phase.

The mixed granulation then was compressed into tablets using a rotary compression machine. The core tablets, if desired, can be film coated with an aqueous suspension of the appropriate color mixture in a coating pan (e.g., Accela Cota). The coated tablets can be lightly dusted with talc to improve tablet handling characteristics.

- 17 -

The tablets can be filled into plastic containers (30 tablets/container) and accompanied by a package insert describing the safety and efficacy of the compound.

5

EXAMPLE 2

By analogous procedures the following formula was used to prepare a finished dosage form
10 of a tablet providing 5 mg of Compound A of Lot 1.

	Ingredient	Quantity (mg)
	Granulation	
15	Compound A (d90 of 4)	5.00
	Lactose Monohydrate	109.655
	Lactose Monohydrate (spray dried)	17.50
	Hydroxypropyl Cellulose	2.80
	Croscarmellose Sodium	6.30
20	Hydroxypropyl Cellulose (EF)	1.225
	Sodium Lauryl Sulfate	0.49
	Outside Powders	
	Microcrystalline Cellulose (Granular-102)	26.25
	Croscarmellose Sodium	4.90
25	Magnesium Stearate (vegetable)	0.88
	Total	175 mg

- 18 -

EXAMPLE 3

By analogous procedures the following
formula was used to prepare a finished dosage form
5 of a tablet providing 2.5 mg of Compound A.

Ingredient	Quantity (mg)
Granulation	
Compound A	2.50
Lactose Monohydrate	79.395
Lactose Monohydrate (spray dried)	12.50
Hydroxypropyl Cellulose	2.00
Croscarmellose Sodium	4.50
Hydroxypropyl Cellulose (EF)	0.875
Sodium Lauryl Sulfate	0.35
Outside Powders	
Microcrystalline Cellulose (Granular-102)	18.75
Croscarmellose Sodium	3.5
Magnesium Stearate (vegetable)	0.63
Total	125 mg

- 19 -

EXAMPLE 4

By analogous procedures the following
formula was used to prepare a finished dosage form
5 of a tablet providing 10 mg of Compound A, without a
film coating.

	Ingredient	Quantity (mg)
	Granulation	
10	Compound A	10.00
	Lactose Monohydrate	153.80
	Lactose Monohydrate (spray dried)	25.00
	Hydroxypropyl Cellulose	4.00
15	Croscarmellose Sodium	9.0
	Hydroxypropyl Cellulose (EF)	1.75
	Sodium Lauryl Sulfate	0.70
	Outside Powders	
	Microcrystalline Cellulose (Granular-102)	37.50
	Croscarmellose Sodium	7.00
20	Stearic Acid (powder)	3.75
	Total	252.5 mg

- 20 -

EXAMPLE 5

By analogous procedures the following formula was used to prepare a finished dosage form
5 of a tablet providing 10 mg of Compound A, without a film coating.

	Ingredient	Quantity (mg)
	Granulation	
10	Compound A	10.00
	Lactose Monohydrate	153.80
	Mannitol	25.00
	Hydroxypropyl Cellulose	4.00
	Croscarmellose Sodium	9.00
15	Hydroxypropyl Cellulose (EF)	1.75
	Sodium Lauryl Sulfate	0.70
	Outside Powders	
	Microcrystalline Cellulose (Granular-102)	37.50
	Croscarmellose Sodium	7.00
20	Magnesium Stearate (vegetable)	1.25
	Total	250 mg

- 21 -

EXAMPLE 6

By analogous procedures the following formula was used to prepare a finished dosage form
5 of a tablet providing 10 mg of Compound A, without a film coating.

	Ingredient	Quantity (mg)
	Granulation	
10	Compound A	10.00
	Lactose Monohydrate	153.80
	Lactose Monohydrate (spray dried)	25.00
	Povidone	4.00
	Croscarmellose Sodium	9.00
15	Povidone	1.75
	Sodium Lauryl Sulfate	0.70
	Outside Powders	
	Microcrystalline Cellulose (Granular-102)	37.50
	Croscarmellose Sodium	7.00
20	Magnesium Stearate (vegetable)	1.25
	Total	250 mg

- 22 -

EXAMPLE 7

By analogous procedures the following formula was used to prepare a finished dosage form
5 of a tablet providing 10 mg of Compound A, without a film coating.

	Ingredient	Quantity (mg)
	Granulation	
10	Compound A	10.00
	Lactose Monohydrate	153.80
	Lactose Monohydrate (spray dried)	25.00
	Povidone	4.00
15	Croscarmellose Sodium	9.00
	Povidone	1.75
	Polysorbate 80	0.70
	Outside Powders	
20	Microcrystalline Cellulose (Granular-102)	37.50
	Croscarmellose Sodium	7.00
	Magnesium Stearate (vegetable)	1.25
	Total	250 mg

- 23 -

EXAMPLE 8

By analogous procedures the following formula was used to prepare a finished dosage form
5 of a tablet providing 10 mg of Compound A, without a film coating.

	Ingredient	Quantity (mg)
	Granulation	
10	Compound A	10.00
	Lactose Monohydrate	157.80
	Lactose Monohydrate (spray dried)	25.00
	Croscarmellose Sodium	9.00
15	Hydroxypropyl Methylcellulose	1.75
	Sodium Lauryl Sulfate	0.70
	Outside Powders	
	Microcrystalline Cellulose (Granular-102)	37.50
	Croscarmellose Sodium	7.00
20	Magnesium Stearate (vegetable)	1.25
	Total	250 mg

- 24 -

EXAMPLE 9

By analogous procedures the following formula was used to prepare a finished dosage form
5 of a tablet providing 10 mg of Compound A, without a film coating.

	Ingredient	Quantity (mg)
	Granulation	
10	Compound A	10.00
	Lactose Monohydrate	153.80
	Sucrose	25.00

15	Hydroxypropyl Cellulose (EF)	1.75
	Sodium Lauryl Sulfate	0.70
	Outside Powders	
	Microcrystalline Cellulose (Granular-102)	37.50
	Croscarmellose Sodium	7.00
20	Magnesium Stearate (vegetable)	1.25
	Total	250 mg

- 25 -

EXAMPLE 10

By analogous procedures the following formula was used to prepare a finished dosage form
5 of a tablet providing 10 mg of Compound A, without a film coating.

	Ingredient	Quantity (mg)
	Granulation	
10	Compound A	10.00
	Lactose Monohydrate	153.80
	Lactose Monohydrate (spray dried)	25.00
	Hydroxypropyl Cellulose	4.00
	Croscarmellose Sodium	9.00
15	Hydroxypropyl Cellulose (EF)	1.75
	Sodium Lauryl Sulfate	0.70
	Outside Powders	
	Microcrystalline Cellulose (Granular-102)	37.50
	Croscarmellose Sodium	7.00
20	Sodium Stearyl Fumarate	1.25
	Total	250 mg

- 26 -

EXAMPLE 11

By analogous procedures the following formula was used to prepare a finished dosage form
5 of a tablet providing 10 mg of Compound A, without a film coating.

	Ingredient	Quantity (mg)
	Granulation	
10	Compound A	10.00
	Lactose Monohydrate	153.80
	Lactose Monohydrate (spray dried)	25.00
	Hydroxypropyl Cellulose	4.00
	Croscarmellose Sodium	9.00
15	Hydroxypropyl Cellulose (EF)	1.75
	Sodium Lauryl Sulfate	0.70
	Outside Powders	
	Croscarmellose Sodium	7.00
	Magnesium Stearate (vegetable)	1.25
20	Total	212.50 mg

- 27 -

EXAMPLE 12

By analogous procedures the following
formula was used to prepare a finished dosage form
5 of a tablet providing 10 mg of Compound A, without a
film coating.

	Ingredient	Quantity (mg)
	Granulation	
10	Compound A	10.00
	Lactose Monohydrate	153.80
	Lactose Monohydrate (spray dried)	25.00
	Hydroxypropyl Cellulose	4.00
	Crospovidone	27.00
15	Hydroxypropyl Cellulose (EF)	1.75
	Sodium Lauryl Sulfate	0.70
	Outside Powders	
	Microcrystalline Cellulose (Granular-102)	19.50
	Crospovidone	7.00
20	Magnesium Stearate (vegetable)	1.25
	Total	250 mg

- 28 -

EXAMPLE 13

By analogous procedures the following
formula was used to prepare a finished dosage form
5 of a tablet providing 10 mg of Compound A, without a
film coating.

	Ingredient	mg/tablet
	Granulation	
10	Compound A	10.00
	Lactose Monohydrate	154.50
	Lactose Monohydrate (spray dried)	25.00
	Hydroxypropyl Cellulose	4.00
15	Croscarmellose Sodium	9.00
	Hydroxypropyl Cellulose (EF)	1.75
	Outside Powders	
	Microcrystalline Cellulose (Granular-102)	37.50
20	Croscarmellose Sodium	7.00
	Magnesium Stearate	1.75
	Total	250.0 mg

The principles, preferred embodiments, and
25 modes of operation of the present invention have
been described in the foregoing specification. The
invention that is intended to be protected herein,
however, is not construed to be limited to the par-
ticular forms disclosed, because they are illus-
trative rather than restrictive. Variations and
30 changes may be made by those skilled in the art
without departing from the spirit of the invention.

- 29 -

WHAT IS CLAIMED IS:

1. A pharmaceutical formulation comprising an active compound having the structural formula

wherein said compound is provided as free drug; a water-soluble diluent; a lubricant; a hydrophilic binder selected from the group consisting of a cellulose derivative, povidone, and a mixture thereof; and a disintegrant selected from the group consisting of croscarmellose sodium, crospovidone, and a mixture thereof.

2. The formulation of claim 1 further comprising microcrystalline cellulose.

3. The formulation of claim 1 further comprising a wetting agent.

- 30 -

4. The formulation of claim 1 wherein the active compound is present in an amount of about 0.5% to about 10% by weight.

5. The formulation of claim 1 wherein the water-soluble diluent is present in an amount of about 50% to about 85% by weight.

6. The formulation of claim 1 wherein the water-soluble diluent is selected from the group consisting of a sugar, a polysaccharide, a polyol, a cyclodextrin, and mixtures thereof.

7. The formulation of claim 3 wherein the water-soluble diluent is selected from the group consisting of lactose, sucrose, dextrose, a dextrose, a maltodextrin, mannitol, xylitol, sorbitol, a cyclodextrin, and mixtures thereof.

8. The formulation of claim 1 wherein the lubricant is present in an amount of about 0.25% to about 2% by weight.

9. The formulation of claim 1 wherein the lubricant is selected from the group consisting of talc, magnesium stearate, calcium stearate, stearic acid, colloidal silicon dioxide, calcium silicate, a starch, mineral oil, a wax, glyceryl behenate, a polyethylene glycol, sodium benzoate, sodium acetate, sodium stearyl fumarate, hydrogenated vegetable oils, and mixtures thereof.

- 31 -

10. The formulation of claim 1 wherein the hydrophilic binder is present in an amount of about 1% to about 5% by weight.

11. The formulation of claim 1 wherein the cellulose derivative is selected from the group consisting of hydroxypropylcellulose, hydroxypropyl methylcellulose, and mixtures thereof.

12. The formulation of claim 1 wherein the disintegrant is present in an amount of about 3% to about 10% by weight.

13. The formulation of claim 2 wherein the microcrystalline cellulose is present in an amount of about 5% to about 40% by weight.

14. The formulation of claim 3 wherein the wetting agent is present in an amount of 0.1% to about 5% by weight.

15. The formulation of claim 14 wherein the wetting agent is selected from the group consisting of sodium lauryl sulfate, docusate sodium, ethoxylated castor oil, a polyglycolyzed glyceride, an acetylated monoglyceride, a sorbitan fatty acid ester, a poloxamer, a polyoxyethylene sorbitan fatty acid ester, a polyoxyethylene, a monoglyceride and ethoxylated derivatives thereof, a diglyceride and ethoxylated derivatives thereof, and mixtures thereof.

- 32 -

16. The formulation of claim 1 wherein the wetting agent is selected from the group consisting of sodium lauryl sulfate, polysorbate 80, and a mixture thereof.

17. The formulation of claim 1 wherein the active compound is provided as particles of a free drug wherein at least 90% of the particles have a particle size less than about 40 microns.

18. The formulation of claim 1 wherein the active compound is provided as particles of a free drug wherein at least 90% of the particles have a particle size less than about 10 microns.

19. The formulation of claim 1 comprising:

(a) about 1% to about 4% by weight of the active compound;

(b) about 50% to about 75% by weight lactose;

(c) about 0.25% to about 2% by weight magnesium stearate;

(d) about 1% to about 5% by weight hydroxypropyl cellulose; and

(e) about 3% to about 10% by weight cros-carmellose sodium.

20. The formulation of claim 18 further comprising about 5% to about 40% by weight micro-crystalline cellulose.

- 33 -

21. The formulation of claim 18 further comprising about 0.1% to about 5% by weight sodium lauryl sulfate.

22. A tablet comprising the formulation of claim 1 wherein the active compound is present in an amount of about 1 to about 20 mg per tablet.

23. A tablet comprising the formulation of claim 1 wherein the active compound is present in an amount of about 5 to about 15 mg per tablet.

24. A tablet comprising the formulation of claim 1 wherein the active compound is present in an amount of about 5 mg or about 10 mg per tablet.

25. A capsule comprising a hard shell encasing the formulation of claim 1 as dry, free-flowing particles, wherein the active compound is present in an amount of about 1 to about 20 mg per capsule.

26. A method of treating sexual dysfunction in a patient in need thereof comprising administering to the patient an effective amount of a formulation of any one of claims 1 through 21.

27. The invention as hereinabove described.

INTERNATIONAL SEARCH REPORT

International Application No

PCT/US 00/11130

A. CLASSIFICATION OF SUBJECT MATTER
 IPC 7 A61K31/495 A61K9/20 A61P15/10

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)
 IPC 7 A61K

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

EPO-Internal, WPI Data, PAJ, CHEM ABS Data, BIOSIS

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	<p>WO 97 03675 A (GLAXO WELLCOME LAB SA ;DAUGAN ALAIN CLAUDE MARIE (FR)) 6 February 1997 (1997-02-06) cited in the application page 1, line 31 -page 2, line 8 page 3, line 24 - line 25 page 3, line 30 -page 4, line 16 page 5, line 15 - line 26; example 1 page 13, line 5 -page 14, line 7; claims 1,2,4-12; example 1 ---- -/-</p>	1-4,6,8, 9,12-14, 16,25-27

Further documents are listed in the continuation of box C.

Patent family members are listed in annex.

* Special categories of cited documents :

- "A" document defining the general state of the art which is not considered to be of particular relevance
- "E" earlier document but published on or after the international filing date
- "L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- "O" document referring to an oral disclosure, use, exhibition or other means
- "P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.

INTERNATIONAL SEARCH REPORT

International Application No. PCT/US 00 A1130

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

Continuation of Box I.2

Claim 27 does not meet the requirements of Article 6 PCT in that the subject-matter for which protection is sought is not clearly defined. A lack of clarity (and/or conciseness) within the meaning of Article 6 PCT arises to such an extent as to render a meaningful search of the claims impossible. Consequently, the search has been carried out for those parts of the application which do appear to be clear (and/or concise), namely claim 27 insofar a composition according to claims 1-26 was concerned.

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.
